RNORadio is a GUI based internet radio player program for MP3 streams, and it's made with Hollywood. The actual streaming and playback is based on the CgmRadio program, but RNORadio still works as a stand-alone program with no dependencies.

Features:

- Two GUI options: MUI or custom skin(s)
- Displays stream titles in real-time from the MP3 metadata
- Comprehensive station editor with an option to download station logos from a local drive or Internet
- Supports multiple streams per station
- Can import streams from PLS, M3U, Extended M3U, and XSPF playlist files
- Has a Shoutcast search window
- Animation support for custom skin elements, including a station's logo
- Alpha transparency support in custom skins with images and animations
- Can display extra information from stations, but currently it only shows the "OneLiner" chat from Nectarine in the MUI GUI
- ARexx, command line, and tooltips support

Please visit its [homepage](#) for more information and download links.
