I have roadshow running on an A3000 , OS3.1.4 - MMUlib and kick 3.1.4 softkicked with the A3640 maprom function.

For some reason - while roadshow works fine already - I can't install the updates. It says " no roadshow files found " or something similar.

It's only on this machine it happened so far out of a lot of other machines I use it and I can't see really much difference apart from the softkicking in this particular way.

Do you use always the same Installer Version?

Try the following in a Shell:

Code:

```
which installer all
```

and then do a "version installer full" on all paths to get the version number.

So ... now I have another freshly installed machine with a 3.1.4 romchip and OS3.9 on top of it with a working Roadshow on it.

I changed all the installers (in C: and Utils)to the installer from the AmigaOS 3.1.4 install disk , version 45.6

All I get is a "no part of roadshow could be found or updated, please try again" while I have a working stack running.

The only difference I see compared to other machines is that I am working with a kickstart 3.1.4 rom .

Ok, I found the "problem" . I downloaded my complete version from AMigaFuture shop account and apparently somewhere down the road it is a version that is updated already to 1.13 so it does not need updating anymore.

It would be great if the installer would say " your version is already up to date " and not " something is wrong " 😊
